Section 1: Coding

1. Problem Statement

John and Mary are collaborating on a project that involves data analysis. They each have a set of age data, one sorted in ascending order and the other in descending order. However, their analysis requires the data to be in ascending order.

Write a program to help them merge the two sets of age data into a single sorted array in ascending order using merge sort.

Input Format

The first line of input consists of an integer N, representing the number of age values in each dataset.

The second line consists of N space-separated integers, representing the ages of participants in John's dataset (in ascending order).

The third line consists of N space-separated integers, representing the ages of participants in Mary's dataset (in descending order).

Output Format participants in Mary's dataset (in descending order).

The output prints a single line containing space-separated integers, which represents the merged dataset of ages sorted in ascending order.

Refer to the sample output for formatting specifications.

Sample Test Case

```
Input: 5
13579
    108642
    Output: 1 2 3 4 5 6 7 8 9 10
    Answer
    #include <stdio.h>
    #include <stdio.h>
    void merge(int arr[], int left, int mid, int right) {
       int n1 = mid - left + 1;
       int n2 = right - mid;
      int leftArr[n1], rightArr[n2];
      // Copy data to temporary arrays
      for (int i = 0; i < n1; i++)
         leftArr[i] = arr[left + i];
      for (int j = 0; j < n2; j++)
         rightArr[i] = arr[mid + 1 + i];
      // Merge the temporary arrays back into arr[left..right]
      int i = 0, j = 0, k = left;
      while (i < n1 \&\& j < n2) {
         if (leftArr[i] <= rightArr[i]) {</pre>
        arr[k] = leftArr[i];
           i++;
         } else {
```

```
240701206
         炉 arr[k] = rightArr[j];
     }
k++;
}
       // Copy the remaining elements of leftArr[], if any
       while (i < n1) {
          arr[k] = leftArr[i];
          j++;
          k++;
       // Copy the remaining elements of rightArr[], if any
       while (j < n2) {
          arr[k] = rightArr[j];
          j++;
          k++;
       }
     }
     void mergeSort(int arr[], int left, int right) {
       if (left < right) {
          int mid = left + (right - left) / 2;
          // Sort first and second halves
         mergeSort(arr, left, mid);
          mergeSort(arr, mid + 1, right);
          // Merge the sorted halves
          merge(arr, left, mid, right);
       }
     }
     int main() {
       int n, m;
       scanf("%d", &n);
       int arr1[n], arr2[n];
scanf("%d", &arr1[i]);
for (int )
       for (int i = 0; i < n; i++) {
       for (int i = 0; i < n; i++) {
```

```
scanf("%d", &arr2[i]);
int merged
                                                                                              240/01206
                                                               240701206
        merged[n + n];
mergeSort(arr1, n);
mergeSort(arr2, n):
merge(m)
        for (int i = 0; i < n + n; i++) {
           printf("%d ", merged[i]);
        }
        return 0;
      }
                                                                                       Marks: 0/10
